- 4:45-5:00 PM Wrap up

This course will qualify for 7.5 hours of 210, POST or CLE credit.

Registration Link is listed at the bottom of page 1.

More about the Trauma Informed Interview Technique

Shifting the Paradigm for Investigating Trauma Victimization

From Battered Women's Justice Project's September 2012 e-newsletter

The Forensic Experiential Trauma Interview (FETI) utilizes information about the parts of the brain that experience trauma. This technique not only reduces the inaccuracy of the information obtained but enhances understanding of the experience, increasing the likelihood that judges and juries will also understand the event. This type of interview technique is being employed by Army CID special agents and other criminal investigators trained by **Russell Strand**, a retired U.S. Army CID special agent and the recently retired chief of the Behavioral Sciences Education & Training Division at the U.S. Army Military Police School.

“Good victims are bad witnesses”, according to Strand, who explains: "Offenders are so good at what they do. They're going to use alcohol, drugs and trauma so (the victims) don't remember much." In addition, the trauma itself impacts the brain, effectively shutting down cognition and leaving the more primitive mid-brain and brainstem to experience and record the event. Strand explains, “While the more primitive portions of the brain are generally very good at recording experiential and sensory information, they do not do very well at recording the type of information law enforcement professionals have been trained to obtain, i.e., the ‘who, what, when, where, why, and how.’” ...
